

Tablet Repair Tracking System (TRTS)

Product Requirements Document

Version: 1.0

Date: March 12, 2026

Status: Draft

Author: Product Management Team

Owner: Head of Support

1. Executive Summary

1.1 Problem Statement

Currently, the support team tracks tablet repairs using a manual Excel spreadsheet. While this approach works for basic record keeping, it introduces several operational challenges:

- ✓ High risk of data entry errors
- ✓ No real-time visibility of repair status
- ✓ Difficult to track device history
- ✓ Time-consuming manual calculations of repair profitability
- ✓ Inefficient searching of historical records
- ✓ Lack of data security, audit trail, and automated backups

As the number of devices increases, managing repairs through spreadsheets becomes inefficient and unreliable.

1.2 Proposed Solution

To address these challenges, we propose developing a **web-based Tablet Repair Tracking System (TRTS)**.

This system will centralize all repair-related activities into a single platform and automate key workflows including:

- ✓ Tablet collection logging
- ✓ Repair status tracking
- ✓ Vendor management
- ✓ Payment tracking
- ✓ Profit calculation
- ✓ Automated reminders and notifications

The system will include a **secure database, intuitive interface, and intelligent notification system** to ensure all devices and payments are tracked efficiently.

1.3 Expected Benefits

Operational Efficiency

Reduce manual data entry by approximately **40%** through standardized forms and automation.

Real-Time Visibility

Instantly track the **status of every device** in the repair cycle.

Financial Transparency

Automatically calculate **profit margins for each repair transaction**.

Accountability

Maintain a **complete audit trail** showing who handled each device and when.

Reduced Operational Risk

Prevent **lost devices, missed follow-ups, and delayed payments**.

1.4 Estimated Investment

The Minimum Viable Product (MVP) is expected to take **approximately 4 weeks** to develop with the following team structure:

- 2 Full-Stack Developers
- 1 QA Engineer

The MVP will replace the existing Excel workflow and introduce automated reminders and repair tracking.

2. Product Overview

2.1 Product Vision

The vision of the **Tablet Repair Tracking System** is to build a **simple, reliable, and automated platform** that manages the complete lifecycle of tablet repairs.

The system will eliminate manual tracking and provide a **transparent workflow from device collection to repair completion and payment settlement**.

Ultimately, the platform will ensure:

- Zero loss of assets
- Improved operational efficiency

- Better financial visibility
- Faster decision-making for support operations

2.2 Target Users

User Role	Description
Support Team Manager	The primary user responsible for managing the entire repair workflow including tablet collection, vendor coordination, payment tracking, and repair completion.

Single User Architecture

The initial version of the system is designed for **a single support team manager** who handles all operations.

Because of this, the system will **not require complex role-based access control or multi-user management.**

Instead, the focus will be on:

- Simplified workflows
- Smart reminders
- Automation
- Mobile accessibility

2.3 Success Metrics (KPIs)

The success of the system will be measured through the following key metrics.

Repair Efficiency

Reduce the number of repairs **pending for more than 15 days.**

Financial Accuracy

Achieve **100% accuracy in profit calculations** compared to actual payment records.

Asset Tracking

Ensure **zero devices are lost or untracked** during the repair process.

3. Notification & Reminder System

An automated notification system will help the support manager stay updated on **delays, pending actions, and payment follow-ups.**

Notifications will be delivered through **three channels**:

- In-App Notifications
- Email Alerts
- WhatsApp Messages

3.1 In-App Notifications

The system will include a **notification bell icon** in the dashboard header.

Features:

- Red badge showing number of pending alerts
- Dropdown showing recent notifications
- Click notification to open related repair ticket
- Mark notifications as read

Example alerts:

Tablet at vendor for more than **7 days**

Payment pending from hospital

Vendor payment pending

3.2 Email Notifications

Email alerts help track repairs and payments through scheduled summaries.

Daily Summary Email

Sent every morning.

Contents include:

- Total pending repairs
- Tablets at vendor for more than 7 days
- Pending hospital payments
- Repairs completed yesterday

Urgent Alerts

Email alerts will also be triggered when:

- Tablet at vendor for **more than 10 days**
- Hospital payment **overdue for more than 20 days**
- Vendor payment **pending for more than 7 days**

3.3 WhatsApp Notifications

WhatsApp alerts ensure that the support manager receives **real-time reminders even when not logged into the system.**

Example messages:

Repair Alert

3 tablets at service centre for more than 7 days.

Please follow up with vendor.

Payment Reminder

Payment pending from hospital for more than 15 days.

Follow-up required.

Daily Summary

Repairs completed yesterday: 2

Repairs in progress: 5

Pending payments: 2

Check dashboard for details.

3.4 Notification Rules

The system will automatically trigger notifications based on predefined conditions.

Trigger Condition	Notification
Tablet at vendor > 7 days	Vendor follow-up reminder
Hospital payment pending > 15 days	Payment reminder
Vendor payment pending > 7 days	Vendor payment alert
Repair completed	Completion notification

These reminders help ensure **no repairs or payments are forgotten.**
